

Cado on Sourceforge - a coder's friend

- a general purpose code generation framework
- rapid prototyping based on sharable templates
- interpretive, seamless shell integration
- ideal for “one-offs”, or for orchestrating multi-step tool chains
- Interpreted - easy to extend

Dear John:

```
letter_template := << (
    {=theDate=}

    Dear {=firstname=},
    I am breaking up with you. {=theReason=}

    {=signoff=},
    {=myname=}
)

CG_SHELL_COMMAND_ARGS = "+%m/%d/%Y"
theDate = $theDate:date
myname = Miss Piggy

firstname = John
theReason = You suck!
signoff = I sincerely hope you rot in Hell
%evalmacro ECHO_TXT letter_template
echo    /${firstname:tolower}.txt

firstname = Bob
theReason = It's not you, $firstname, it's me.
signoff = Regrettably
%evalmacro ECHO_TXT letter_template
echo    /${firstname:tolower}.txt
```

the result:

==> letters/bob.txt <==

03/27/2012

Dear Bob,

I am breaking up with you. It's not you, Bob, it's me.

Regrettably,
Miss Piggy

==> letters/john.txt <==

03/27/2012

Dear John,

I am breaking up with you. You suck!

I sincerely hope you rot in Hell,
Miss Piggy

Easy to extend:

mytolower.pl:

```
sub mytolower_op
{
    my ($var) = @_;
    $var =~ tr/[A-Z]/[a-z]/;
    return $var;
}
1;
```

foo.cgi:

```
%pragma require mytolower.pl
```

```
FOO = FOO
```

```
%echo FOO=$FOO:mytolower
```

result:

```
# cado -u foo.cgi
FOO=foo
```

lots of built-in ops:

```
:assign, :a :append :insert :nameof :undef :valueof :zero :clr :clrifndef  
:env :pwd  
:decr :incr, :i :isint :pad :plus<n> :minus<n> :times<n> :div<n> :rem<n>  
:xmlcomment :xmlcommentblock :_<element_name> :stripxmlcomments  
:indent<n> :basename :dirname :suffix :root :cap :uncap :onecol  
:oneline :lnewline :rnewline :newline, :nl :fixeol :eoltrim :eolsqueeze  
:ltrim :rtrim :trim :g  
:substitute :s :s2,:s3,:s4,:s5 :substituteliteral :sl :lspace :rspace :space  
:tab :cgvar :quote,:q  
:dquote,:dq :todos :tounix :toupper :tolower :hexencode :hexdecode :urlencode  
:urldecode :crc :crcfile  
:crcstr :freq :studyclass :stripRcsKeywords :method2rec :init_objc_ptr  
:top :bottom :car :cdr :split :stacksize :stackminus :showstack :unique :dups  
:antvar :parse_antprops :clear_antprops :expand_antprops :showantvars  
:expand_antrefs :antpropvalue  
:antpropnames :isantprop :factorShSubs  
:factorShVars :factorCshVars :B  
:T :d :e :f :l :r :sz :w :x :z  
:createtime :modtime  
:eq :ne :ge :gt :le :lt :match :m  
:rangelb :rangeub  
:openfile :closefile :getline :currentline :currentlinenumber  
:pv :pragmavalue
```

some applications

- convert wiki languages:
 - <https://github.com/russt/wikiconvert>
- convert builds from ant to maven
- convert old source from sccs->cvs->subversion
- generate customized build system
- generate test scripts!
